

Paint repairs

Colorworks addresses all the small autobody damage found on a vehicle:

(before)

(after)

from blending scuffs, scrapes and rubs,

to touching up chips and scratches,

to fixing the general deterioration of the shine due to climatic and ultraviolet effects.

We do it all out of specially equipped trucks complete with on-board paint mixing equipment - on the spot. Colors are matched exactly to your vehicle accounting for fading, yellowing and uv discoloration. The matched paint is then applied using a specialized spray gun to spray areas as small as the size of a small paint chip. When blending larger areas the repair is virtually the quality of a body shop repair. Colorworks can address all the finishes in the auto market today from: basecoat/clearcoat systems; single stage applications; flat and glossy sheens; flexible substrates; and texture coat. We use only the finest in equipment and materials to generate the best results.

Colorworks provides services for the cosmetic enhancement of the exterior finish of late model cars and light trucks. Our service was originally tailored to meet the needs of the commercial automobile market - those who look for a cost effective, aesthetically pleasing method of fixing minor paint imperfections on their inventory of cars. The success of the Colorworks program with dealers has pushed Colorworks into advanced repair service in the automotive aftermarket. We are positioned between a detail service, who undertake washing, waxing and cleaning of cars, and a body shop which repaint complete panels.
